

## **Design, realization and statistical analysis of animal trials**

Animal production, like other productive systems, need to test new products, techniques or protocols before its general application to production farms. In order to obtain reliable results, but also with low trial cost, a good statistical and technical design is needed. Finally, the data statistical analysis should be performed carefully.

Knowledge about animal production and statistic of T&T components allows us to offer a quality service devoted mainly to:

Companies devoted to animal production products that want to tests its products.

Companies devoted to animal production that want to test new techniques or products in their farms.

T&T could give all the services related with animal trials, from design, including in field trial realization, and statistical analysis and technical discussion of results . The main areas of T&T study were:

Nutritional trials ( additives, flavors, nutritional levels,....)

Protocols (new techniques tests, management protocols, facilities,...)

Veterinarian products (new product trials for registry, application protocols,...)
